

The NASA/IPAC Teacher Archive Research Program (NITARP) is Recruiting New Educators!

High-level summary

The NASA/IPAC Teacher Archive Research Program (NITARP; <http://nitarp.ipac.caltech.edu>) gets educators involved in authentic astronomical research. We partner small groups of educators with a mentor professional astronomer for a year-long original research project using NASA's vast archives of astronomical data from space- and ground-based telescopes. In exchange, we ask educators to leverage this experience by providing professional development for their colleagues in their local school districts. It involves trips for educator participants and their students to collaborate with scientists and present the research results, all of which are paid for by the program. The program is funded completely via a NASA ADAP grant, and is contingent on the availability of funds, and the ability to travel within the US (e.g., a lessening of the pandemic restrictions).

While most of the work on these teams is done remotely using video conferencing and other online collaboration tools, the structure of the program heavily relies on three different face-to-face visits, necessarily requiring interstate travel and meeting in groups. If the January 2023 AAS meeting is held online because of the pandemic, we may not be able to have a NITARP class of 2023. We will monitor the situation closely and inform applicants of progress as decision points come up.

Background

IPAC at Caltech is soliciting applications from educators with experience in astronomy (and bringing scientific research into the classroom or into other educational venues) to conduct research with a team of educators and a mentor scientist.

The **purpose of this program** is to provide educators with an authentic research experience in astronomy using data housed in NASA archives at IPAC at the California Institute of Technology in Pasadena, California.

The intensive work in the program runs January to January. Since we only have a year to complete an original research program, we require some baseline astronomy knowledge of all our participants. Educators who have experience with real astronomy data are ideal candidates.

Historically, we have targeted grade 9-12 teachers, but 8th grade and community college educators have also participated, as have non-traditional educators such as museum educators, amateur astronomers who do a lot of outreach, and educators not currently in the classroom.

The NITARP teams use archival data from many different NASA Astronomy missions, including but not limited to data housed at the NASA/IPAC Infrared Science Archive (IRSA), such as data from the Spitzer Space Telescope (one of NASA's Great Observatories), the Widefield Infrared Survey Explorer (WISE), and Planck; data housed at NExScI, and the NASA

Exoplanet Archive, such as data from Kepler and CoRoT; data from the NASA/IPAC Extragalactic Database (NED); and/or other NASA astronomy archive holdings.

Program components

The main program components involve multiple trips (for which NITARP pays) and a commitment from the teachers to educate others about their experiences, both of which are conducted over a minimum of 18 months to 2 years. There are 6 specific program components, which we now explain in more detail.

1. **Attending a NITARP workshop** held in Seattle, WA at the American Astronomical Society (AAS) meeting in January 2023. The purpose of this workshop is to meet your team, meet your scientist, learn about the basics of the NASA archives to be used, and start to define the research project to be conducted. The reason for attending the AAS meeting (and not just returning home immediately after the workshop) is to understand how AAS meetings work and to learn about current astronomy research and how research is presented in posters; time will also be spent continuing to work with your team to define your project. Your project may be something that you or another teacher in your group initiates, or it may be something that your scientist mentor suggests, or some combination of the two; your team will discuss it in person.

The AAS meeting starts the evening of Sunday January 8, 2023 and goes through Thursday January 12. Our NITARP workshop is currently scheduled for Sunday, January 8, necessitating travel on Jan 7. Participants are expected to attend the AAS from Monday (Jan 9) through Tuesday (Jan 10), but are encouraged to stay through the end of the meeting on Thursday, (Jan 12), if your schedule permits. *You must attend this meeting. Applicants who state that they cannot attend the AAS meeting will not be accepted, even if the conflict is related to science fairs or sports coaching commitments.*

2. **Working long distance** with each other on a research program that uses data from any of the IPAC holdings, including but not limited to IRSA, NED, and/or the NASA Exoplanet Archive, in conjunction with NASA scientists, using telephone conferences (telecons) and internet-based resources such as email and a wiki (where everyone with an account on the system can edit pages, post images or proposal drafts, ask and answer questions, etc.). *You must be comfortable collaborating over phone and email. (There is a LOT of email!)*

3. **Meeting for 4 days** in Pasadena, California at Caltech (specifically IPAC) to work on the data and to understand the process of doing your science. Each team will decide when to meet (dates TBD by your team, probably – but not necessarily – in the Summer of 2023). This program is primarily for educators, but in order to support your educational efforts, we anticipate that, contingent on availability of funds, you may have the opportunity to bring up to 2 students per educator to IPAC. If you choose to bring students, they must be heavily involved in the project; more details will be available to the teachers in the program to guide their student selection.

4. **Attending the AAS meeting** in New Orleans, LA in January 2024 to present results of your project, both from a scientific and educational perspective. We anticipate that, contingent on availability of funds, you may again bring up to 2 students per educator to the AAS.

Travel costs associated with all three of these meetings (trip to AAS meeting to get started, trip to IPAC to work on project, and trip to AAS to present project results) are covered by NITARP to the extent they comply with Federal travel expenditure rules. If we do not believe we have funds, we will not go on the trip, *so you will never be left hanging with unreimbursed compliant travel expenses.*

5. Serving as NASA/NITARP ambassadors who give 12 hours of professional development workshops in their home school districts. Each educator will be expected to give the equivalent (in hours) of 3 half-day professional development workshops in their district, or neighboring school districts, and at least 3 talks on the project (e.g., local, state, regional, or national teacher conferences) over the first 18 months to 2 years of your time in the program. The professional development workshops can focus on just one aspect of your project (e.g., infrared astronomy).

6. Serving as mentors in the community of NITARP teachers. Educators are expected to participate in the NITARP community. Educators may be invited to join new teams explicitly as mentor teachers for new teams. Additional activities and opportunities may be available to the alumni community.

Educators are asked to submit regular reports to us at IPAC describing project-related activities (workshops, etc.).

Summary and High-Level Timeline

1. **May 2022:** Release of this application
2. **June 2022:** Application website opens to accept applications.
3. **12 September 2022:** Deadline for application submission; web-based interviews of short-list candidates the following week.
4. **Late September/early October 2022:** Applicants notified of application status (acceptance/rejection) and assigned to teams with mentor astronomer.
5. **January 2023:** Go to the American Astronomical Society (AAS) meeting in Seattle, WA to meet the astronomer you will work with, meet your team, and get a sense of how astronomy research is done and presented.
6. **Spring 2023:** work remotely by e-mail and telephone with your astronomer to write a proposal to use archival astronomical data to address a specific astronomical question.
7. **Summer 2023:** Travel with up to two students to Pasadena to IPAC at Caltech for 4 days to train in analyzing the data for your science.
8. **Fall 2023:** Use the knowledge gained at IPAC back at your school to analyze the data and write a poster presentation about your scientific results.
9. **January 2024:** Present your results at the AAS meeting in New Orleans, LA.
10. **Rest of 2024:** Give 12 hours of professional development workshops in your community based on your experience in NITARP.
11. **Beyond 2024:** Stay involved with the program, with the possibility of becoming a mentor to support another team of NITARP teachers.

For more detailed milestones over a given NITARP cycle, please see our website (below).

Evaluation Criteria and Important Notes

Is this program for you? If you are selected for this program, and accept our offer of participation in the program, here are some things you need to know:

- (1) ... You will be traveling using government guidelines as part of the program. As such, complex and potentially non-intuitive travel restrictions may apply. *In some instances, **you will be asked to float a balance** for your travel expenses (like your hotel bill) over a credit card billing cycle before your reimbursement can be processed.* We cannot cover substitute charges, but the per diem rates are generous and are likely to cover most if not all of such fees. **We cannot pay salary.**
- (2) ... We will use your name in conjunction with media events (such as press releases) associated with the entire program. If you have concerns regarding the use of your name as associated with this program (e.g., your institution would not approve, or you wish not to be seen as affiliated with NITARP), this may not be the program for you. Please contact us if you have specific questions.
- (3) ... Students can be involved, but **this is not required.** (a) Any students you bring need to be heavily involved in the program; and (b) you are *not* obligated to bring two students on the two trips with student participation. It is just fine to bring just one, or none, if you believe that your participation is best served by such a decision. This program's goal is first to give *you* the experience, and secondly (really, *through* you) your students. On the other extreme, if you raise your own money, depending on your team, you may be able to bring more than 2 students on the trips, but more than 4 is strongly discouraged. You may involve as many students as you want at your home institution.
- (4) ... This is real research, the real deal. We don't know what you will find until after you do the work. And, by extension, this project does not easily fold itself into an existing classroom curriculum. It is a much more authentic model/experience that teaches collaborative research. Parts of it are useful in a classroom, **but it is not a prepackaged curriculum in itself.** We rely on you to translate your experience into your environment.
- (5) ... Most of your interaction with your team will be over email and phone teleconferences, because you will not necessarily all be co-located in the same area or even the same time zone. If you are not a regular user of email for communication, it will be extremely difficult to accomplish the necessary tasks during your first year of intensive work. **There is a lot of email.**
- (6) ... You need to know the basics of the astronomy, math, and computers that you need for this program. For example, if you are a biologist suddenly stuck with an astronomy teaching assignment, this program is **not** how to start learning about astronomy. This program starts from the assumption that you are up to speed on college-level Astronomy 101, and is intended to share with you how science really works.
- (7) ... Team applications are not accepted. Generally, only one teacher per school is accepted into the program.
- (8) ... Have you been through the program before, but as a student, and now you want to go through as an educator? We welcome your application but we require additional information from you (see application section 7) with regards to what you expect to learn as a NITARP educator that you did not learn as a NITARP student.

What are we looking for? The application is below and consists of short-form answers to questions. When we read your application, we are trying to assess the following criteria:

- Are you reasonably up-to-speed on the astronomy, math, and computers you will need for this program? We only work with you intensively for a year, and we don't necessarily have time to "start at the beginning" on all of those three topics. **You should be reasonably comfortable with the basics of all three of those topics**, because many aspects of the program will feel like the deep end of the pool.
- Are you comfortable working in groups, remotely, even with people you have just met? Most of the work in this program is over email, wikis, and teleconferences. If you can't work remotely with your team, this program will be very hard for you, and for the rest of your team who is depending on you to pull your weight. **You need to be able to read and reply to email regularly, because there is a lot of email.**
- Are you already getting your students involved in research? This program focuses on doing authentic science, **not on tips and techniques for getting students involved in research** and/or including research in your curriculum. There are other resources for developing those skills (such as AAPT); you will most likely not learn this from us.
- Is our investment in you going to be well spent? We need you to get out there and **share what you have learned** with your environment, whether that be any combination of the following: your peer educators, amateur astronomers, your community, and/or more students; locally, regionally, and/or nationally; in print, online, and/or in person.
- Our primary audience has been (and continues to be) high school classroom teachers. By necessity, then, educators not in high school classrooms (community college, 8th grade, informal educators) must demonstrate in their application that they can fit into this framework – a middle school educator needs to explain how they will bring the experience to the level of their students, or a museum educator needs to explain how they will share the experience with their museum patrons, etc.
- What skills are you already bringing to the table? Maybe you have experience with databases. Or you spent a lot of time looking at images, asteroid hunting. Or, you have experience with astronomy in a wavelength not explicitly included in IRSA databases (such as radio or gamma-ray astronomy). If you don't have an advanced degree in science, you're our primary audience. If you already have a PhD or MS in astronomy, you are not our target audience, because you've already actually done science. In any case, please **make all of this clear in your application.**

The Application

Applications are due by 3pm Pacific time (6pm Eastern time) Monday, September 12, 2022.

The program is likely to be oversubscribed and all teachers qualified for this program will not be selected.

All US-based educators (formal or informal) are eligible. Teachers are expected to know the basics of astronomy and computers (e.g., what is a magnitude, what is a FITS file and how to use it, how to install software on your computer, etc.). Fairly recent vintage laptops will be required for the IPAC visit, as well as the ability to install software on said laptops. This program is

primarily aimed at 9th-12th grade teachers but 8th grade teachers and/or community college professors, and/or non-classroom or non-traditional educators may also apply.

The NITARP teacher application consists of a series of short answers to questions, submitted as a PDF file to a website. (PDF files can be created from Word using the file print---save as PDF command.) The questions are below. Please include the various question headings before each of your answers (note that you can copy-and-paste from this PDF file). **There is a 3-page limit, 12-point font, 1-inch margins. The application should be submitted to the website <https://catcopy.ipac.caltech.edu/nitarp/> (note https, not http) by the deadline.** This website will be open and available to accept applications starting **in June 2022**. This 3-page limit is a total page limit, not pages per question.

Review and ranking will be conducted by a committee composed primarily of representatives from IPAC, including the scientists who will mentor NITARP teams in 2023. Additional representatives from NITARP alumni and other astronomy education programs are likely to also be involved.

We expect to conduct very brief (~15 min) web-based interviews using Zoom with the short list of candidates. These interviews will be arranged individually with the people on the short list of candidates during the two weeks after the application deadline.

Educators who have applied before but were not selected are encouraged to apply again, ideally taking into consideration the feedback given. All applicants will be notified of the status of their application within 3-4 weeks of the application deadline.

The web form includes:

- Name
- School
- School Address
- School Phone Number
- Grades Currently Taught
- Subjects Currently Taught
- Mailing Address for Correspondence
- Email address for Correspondence

And a place to upload your PDF.

Your PDF should include short essay answers to the following questions (note that you should include the headings but need **not** copy the entire question into your answer, and repeat applicants should note that **there is a new question in 2023**):

1. Educational Background-General

Describe your educational background, degrees, and subjects studied. Relate how this background sets a foundation for being part of an astronomy research team. Why did you become a science teacher?

2. Educational Background-Specific

Describe your specific background in physics and astronomy, if applicable. Describe your experience with scientific research in general and with astronomy in particular. Be specific about any analysis of astronomical data in which you may have participated. Be specific about your involvement in projects and how it might relate to being a NITARP teacher. Describe your involvement in any NSF or NASA-funded education projects or scientific research projects. Describe any grants you have received or leadership roles you have assumed.

3. Experience with Student Research and Productivity

Describe your role in encouraging student research. (Hint: we do not mean sending your students to the library.) Describe how you currently use research projects in the classroom or other educational settings. Do you use inquiry-based learning or modeling in science labs in the classroom? Describe in general how you have made good use of experiences that attempt to bring research into your classroom or your educational venue.

4. Experience with Inclusion, Diversity, Equity, and Access (IDEA).

IDEA motivates efforts towards engaging communities underrepresented in the sciences, including but not limited to race, color, ethnicity; gender identity, sexual orientation or identity; religion, nationality, language; age; economic class, geography; educational level; physical, mobility, ability, neurodiversity; marital or parental status. Describe any of your experience(s) (including lived experiences if you wish) with respect to IDEA in the sciences.

5. Ability to participate

Describe your ability to participate in a long-term research project, including support of school district and administrators for your involvement in this project and ability to miss school. Be as specific as possible about the level of support and flexibility of your district. Are you able to attend all of the program dates set so far (i.e., the AAS in January)? If not, please explain.

6. Ability to share the experience

Describe very briefly your general plan for your 12 hours of professional development presentations/workshops associated with this project. We realize the details of your plans will change once you get into this, but one of the main strengths of the NITARP program is the ability of our graduates to take the experience into the education and wider communities and inspire the next generation of scientists. How will you bring your NITARP experience back to your local environment? (Hint: workshops at NSTA are not generally enough.)

7. You and your NITARP team

Describe your aptitude for astronomical research and why you want to be part of a team of NITARP teachers. What educational or scientific strengths do you bring to the team? How will you integrate the NITARP experiences with your teaching? Are you able to function on a research team that may be under some pressure to meet deadlines? Do you have any ideas for research that can be conducted using Spitzer, IRSA, NED, and/or the NASA Exoplanet Archive?

8. Benefits

What are you hoping to get out of this experience? Be specific about what impact you expect this program to make on your teaching and in your school environment. For those educators who have participated in NITARP as students, please include what you expect to get out of the program by now participating as an educator.

9. Advertising

How did you hear about us? (We are always trying to improve our advertising and recruitment.)

Applications are due by 3pm Pacific time (6pm Eastern time) Monday September 12, 2022.

If you have any questions, please contact us via our central email at nitarp@ipac.caltech.edu -- email is likely to result in the fastest response (especially since we may be working remotely due to COVID), but if you would like to have a phone conversation, please contact us:

Dr. Luisa Rebull, NITARP Director, 626-395-4565

- or -

Dr. Varoujan Gorjian, 818-354-2068

More information on the program (including projects past teams have completed) can be found at <https://nitarp.ipac.caltech.edu/>
